

5 PYRIMIDINE DERIVATIVES FOR THE TREATMENT OF ABNORMAL CELL GROWTHBackground of the Invention

This invention relates to novel pyrimidine derivatives that are useful in the treatment of abnormal cell growth, such as cancer, in mammals. This invention also relates to a method of using such compounds in the treatment of abnormal cell growth in mammals, especially
10 humans, and to pharmaceutical compositions containing such compounds.

It is known that a cell may become cancerous by virtue of the transformation of a portion of its DNA into an oncogene (i.e., a gene which, on activation, leads to the formation of malignant tumor cells). Many oncogenes encode proteins that are aberrant tyrosine kinases capable of causing cell transformation. Alternatively, the overexpression of a normal proto-oncogenic
15 tyrosine kinase may also result in proliferative disorders, sometimes resulting in a malignant phenotype.

Receptor tyrosine kinases are enzymes which span the cell membrane and possess an extracellular binding domain for growth factors such as epidermal growth factor, a transmembrane domain, and an intracellular portion which functions as a kinase to
20 phosphorylate specific tyrosine residues in proteins and hence to influence cell proliferation. Other receptor tyrosine kinases include c-erbB-2, c-met, tie-2, PDGFr, FGFr, and VEGFR. It is known that such kinases are frequently aberrantly expressed in common human cancers such as breast cancer, gastrointestinal cancer such as colon, rectal or stomach cancer, leukemia, and ovarian, bronchial or pancreatic cancer. It has also been shown that epidermal growth factor
25 receptor (EGFR), which possesses tyrosine kinase activity, is mutated and/or overexpressed in many human cancers such as brain, lung, squamous cell, bladder, gastric, breast, head and neck, oesophageal, gynecological and thyroid tumors.

Accordingly, it has been recognized that inhibitors of receptor tyrosine kinases are useful as selective inhibitors of the growth of mammalian cancer cells. For example, erbstatin, a
30 tyrosine kinase inhibitor, selectively attenuates the growth in athymic nude mice of a transplanted human mammary carcinoma which expresses epidermal growth factor receptor tyrosine kinase (EGFR) but is without effect on the growth of another carcinoma which does not express the EGF receptor. Thus, selective inhibitors of certain receptor tyrosine kinases, are useful in the treatment of abnormal cell growth, in particular cancer, in mammals. In addition to receptor
35 tyrosine kinases, selective inhibitors of certain non-receptor tyrosine kinases, such as FAK (focal adhesion kinase), lck, src, abl or serine/threonine kinases (e.g.: cyclin dependent kinases, are useful in the treatment of abnormal cell growth, in particular cancer, in mammals. FAK is also known as the Protein-Tyrosine Kinase 2, PTK2.

Convincing evidence suggests that FAK, a cytoplasmic, non-receptor tyrosine kinase,
40 plays an essential role in cell-matrix signal transduction pathways (Clark and Brugge 1995, Science 268: 233-239) and its aberrant activation is associated with an increase in the

5 metastatic potential of tumors (Owens et al. 1995, Cancer Research 55: 2752-2755). FAK
was originally identified as a 125 kDa protein highly tyrosine-phosphorylated in cells
transformed by v-Src. FAK was subsequently found to be a tyrosine kinase that localizes to
focal adhesions, which are contact points between cultured cells and their underlying
10 substratum and sites of intense tyrosine phosphorylation. FAK is phosphorylated and, thus,
activated in response to extracellular matrix (ECM)-binding to integrins. Recently, studies
have demonstrated that an increase in FAK mRNA levels accompanied invasive
transformation of tumors and attenuation of the expression of FAK (through the use of
antisense oligonucleotides) induces apoptosis in tumor cells (Xu et al. 1996, Cell Growth and
Diff. 7: 413-418). In addition to being expressed in most tissue types, FAK is found at
15 elevated levels in most human cancers, particularly in highly invasive metastases.

Various compounds, such as styrene derivatives, have also been shown to possess
tyrosine kinase inhibitory properties. Five European patent publications, namely EP 0 566 226
A1 (published October 20, 1993), EP 0 602 851 A1 (published June 22, 1994), EP 0 635 507 A1
(published January 25, 1995), EP 0 635 498 A1 (published January 25, 1995), and EP 0 520 722
20 A1 (published December 30, 1992), refer to certain bicyclic derivatives, in particular quinazoline
derivatives, as possessing anti-cancer properties that result from their tyrosine kinase inhibitory
properties.

Also, World Patent Application WO 92/20642 (published November 26, 1992), refers to
certain bis-mono and bicyclic aryl and heteroaryl compounds as tyrosine kinase inhibitors that
25 are useful in inhibiting abnormal cell proliferation. World Patent Applications WO96/16960
(published June 6, 1996), WO 96/09294 (published March 6, 1996), WO 97/30034 (published
August 21, 1997), WO 98/02434 (published January 22, 1998), WO 98/02437 (published
January 22, 1998), and WO 98/02438 (published January 22, 1998), also refer to substituted
bicyclic heteroaromatic derivatives as tyrosine kinase inhibitors that are useful for the same
30 purpose.

Accordingly, a need exists for additional selective inhibitors of certain receptor and non-
receptor tyrosine kinases, useful in the treatment of abnormal cell growth, such as cancer, in
mammals. The present invention provides for novel pyrimidine derivatives which are selective
inhibitors of the non-receptor tyrosine kinase, FAK, and are useful in the treatment of abnormal
35 cell growth.

The phrase "pharmaceutically acceptable salt(s)", as used herein, unless otherwise 30 indicated, includes salts of acidic or basic groups which may be present in the compounds of the present invention. The compounds of the present invention that are basic in nature are capable of forming a wide variety of salts with various inorganic and organic acids. The acids that may be used to prepare pharmaceutically acceptable acid addition salts of such basic compounds of are those that form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable 35 anions, such as the hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate, bisulfate, phosphate, acid phosphate, isonicotinate, acetate, lactate, salicylate, citrate, acid citrate, tartrate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3- 40 naphthoate)] salts. The compounds of the present invention that include a basic moiety, such as

5 an amino group, may form pharmaceutically acceptable salts with various amino acids, in addition to the acids mentioned above.

Those compounds of the present invention that are acidic in nature are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline earth metal salts and, particularly, the calcium, magnesium,
10 sodium and potassium salts of the compounds of the present invention.

Certain functional groups contained within the compounds of the present invention can be substituted for bioisosteric groups, that is, groups which have similar spatial or electronic requirements to the parent group, but exhibit differing or improved physicochemical or other properties. Suitable examples are well known to those of skill in the art, and include, but are not
15 limited to moieties described in Patini et al., Chem. Rev, 1996, 96, 3147-3176 and references cited therein.

The compounds of the present invention have asymmetric centers and therefore exist in different enantiomeric and diastereomeric forms. This invention relates to the use of all optical isomers and stereoisomers of the compounds of the present invention, and mixtures
20 thereof, and to all pharmaceutical compositions and methods of treatment that may employ or contain them. The compounds of formula 1 may also exist as tautomers. This invention relates to the use of all such tautomers and mixtures thereof.

The subject invention also includes isotopically-labelled compounds, and the pharmaceutically acceptable salts, solvates and prodrugs thereof, which are identical to those
25 recited in formula 1, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{35}S , ^{18}F , and ^{36}Cl , respectively. Compounds
30 of the present invention, prodrugs thereof, and pharmaceutically acceptable salts of said compounds or of said prodrugs which contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as ^3H and ^{14}C are incorporated, are useful in drug and/or substrate tissue distribution assays.
35 Tritiated, i.e., ^3H , and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e., ^2H , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labelled compounds of formula 1 of this
40 invention and prodrugs thereof can generally be prepared by carrying out the procedures

5 disclosed in the Schemes and/or in the Examples and Preparations below, by substituting a readily available isotopically labelled reagent for a non-isotopically labelled reagent.

This invention also encompasses pharmaceutical compositions containing and methods of treating bacterial infections through administering prodrugs of compounds of the formula 1. Compounds of formula 1 having free amino, amido, hydroxy or carboxylic groups can be
10 converted into prodrugs. Prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e.g., two, three or four) amino acid residues is covalently joined through an amide or ester bond to a free amino, hydroxy or carboxylic acid group of compounds of formula 1. The amino acid residues include but are not limited to the 20 naturally occurring amino acids commonly designated by three letter symbols and also includes 4-
15 hydroxyproline, hydroxyllysine, demosine, isodemosine, 3-methylhistidine, norvalin, beta-alanine, gamma-aminobutyric acid, citrulline homocysteine, homoserine, ornithine and methionine sulfone. Additional types of prodrugs are also encompassed. For instance, free carboxyl groups can be derivatized as amides or alkyl esters. Free hydroxy groups may be derivatized using groups including but not limited to hemisuccinates, phosphate esters, dimethylaminoacetates, and phosphoryloxymethyloxycarbonyls, as outlined in *Advanced Drug Delivery Reviews*, **1996**,
20 19, 115. Carbamate prodrugs of hydroxy and amino groups are also included, as are carbonate prodrugs, sulfonate esters and sulfate esters of hydroxy groups. Derivatization of hydroxy groups as (acyloxy)methyl and (acyloxy)ethyl ethers wherein the acyl group may be an alkyl ester, optionally substituted with groups including but not limited to ether, amine and carboxylic acid functionalities, or where the acyl group is an amino acid ester as described above, are also
25 encompassed. Prodrugs of this type are described in *J. Med. Chem.* **1996**, 39, 10. Free amines can also be derivatized as amides, sulfonamides or phosphonamides. All of these prodrug moieties may incorporate groups including but not limited to ether, amine and carboxylic acid functionalities.

30 Detailed Description Of The Invention

The compounds of formula 1 can be prepared using the following synthetic scheme 1. The substituents in scheme 1 have the same meaning as the substituents defined for formula 1. The substituent Lg in the compounds of formulas **2** and **4** is a leaving group. Leaving groups are well-known to those of ordinary skill in the art. Applicants also direct the reader's attention to the
35 Experimental section for particular examples of leaving group employed in the preparation of the compounds of the present invention.

Scheme 1

- Necessary starting materials may be purchased and used directly or alternatively, starting materials can be prepared by one skilled in the art utilizing known procedures obtained from standard chemistry references (such as, Organic Synthesis (McGraw Hill) Michael Smith). It is understood that starting materials may be optionally protected as to not interfere with a desired chemical reaction (see Protecting Groups in Organic Synthesis (Wiley-Interscience), Green and Wutts). Subsequent de-protection of potentially interfering functional group may be effected at a later appropriate time to obtain the necessary desired material. A pyrimidine of the general formula I may be purchased or prepared from known materials by one skilled in the art. Lg is defined as a displaceable leaving group that includes halogens and sulfonyl groups.

Using methods known in the literature by one skilled in the art, a pyrimidine of formula 2 may be reacted together with a compound of formula 3, optionally in the presence of a suitable base and optionally in the presence of a suitable inert solvent and at a temperature range of 0°C to 150°C. Suitable bases employed may be the following but not limited to (i) organic bases, for example triethylamine, or diisopropylethylamine and (ii) inorganic bases such as potassium carbonate or cesium carbonate. The reaction may be performed neat or carried out in a suitable inert solvent. Examples of suitable inert solvents are but not limited to tetrahydrofuran, 1,4-dioxane, dimethylformamide, n-methyl pyrrolidin-2-one, ethanol, butanol, dichloromethane, or acetonitrile. Followed by the next reaction in which pyrimidine of formula 4 may be reacted together with amine compounds of formula IV optionally in the presence of a suitable base and optionally in the presence of a suitable inert solvent and at a temperature range of 0°C to 150°C

5 conveniently at or near reflux to obtain compounds of formula 6. The reaction may be performed neat or optionally carried out in a suitable inert solvent. Examples of suitable inert solvents are but not limited to tetrahydrofuran, 1,4-dioxane, dimethylformamide, n-methyl pyrrolidin-2-one, ethanol, butanol, dichloromethane, dimethyl sulfoxide or acetonitrile.

10 Compounds of formula 6, if optional protecting groups are present would be removed using standard techniques well-known to those of ordinary skill in the art, see for example, Protecting Groups in Organic Synthesis (Wiley-Interscience), Green and Wuts. These methods are known to those skilled in the art and include a) removal of a protecting group by methods outlined in T. W. Greene and P.G.M. Wuts, "Protective Groups in Organic Synthesis", Second Edition, John Wiley and Sons, New York, 1991; b) displacement of a leaving group (halide, mesylate, tosylate, etc) with a primary or secondary amine, thiol or alcohol to form a secondary
15 or tertiary amine, thioether or ether, respectively; c) treatment of phenyl (or substituted phenyl) carbamates with primary or secondary amines to form the corresponding ureas as in Thavonekham, B et. al. Synthesis (1997), 10, p1189; d) reduction of propargyl or homopropargyl alcohols or N-BOC protected primary amines to the corresponding E-allylic or E-homoallylic
20 derivatives by treatment with sodium bis(2-methoxyethoxy)aluminum hydride (Red-Al) as in Denmark, S. E.; Jones, T. K. J. Org. Chem. (1982) 47, 4595-4597 or van Benthem, R. A. T. M.; Michels, J. J.; Speckamp, W. N. Synlett (1994), 368-370; e) reduction of alkynes to the corresponding Z-alkene derivatives by treatment hydrogen gas and a Pd catalyst as in Tomassy, B. et. al. Synth. Commun. (1998), 28, p1201 f) treatment of primary and secondary amines with
25 an isocyanate, acid chloride (or other activated carboxylic acid derivative), alkyl/aryl chloroformate or sulfonyl chloride to provide the corresponding urea, amide, carbamate or sulfonamide; g) reductive amination of a primary or secondary amine using $R^1CH(O)$; and h) treatment of alcohols with an isocyanate, acid chloride (or other activated carboxylic acid derivative), alkyl/aryl chloroformate or sulfonyl chloride to provide the corresponding carbamate,
30 ester, carbonate or sulfonic acid ester.

The compounds of the present invention may have asymmetric carbon atoms. Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods known to those skilled in the art, for example, by chromatography or fractional crystallization. Enantiomers can be separated by converting the
35 enantiomeric mixtures into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., alcohol), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. All such isomers, including diastereomeric mixtures and pure enantiomers are considered as part of the invention.

The compounds of formulas 1 that are basic in nature are capable of forming a wide
40 variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to

5 initially isolate the compound of formula 1 from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent and subsequently convert the latter free base to a pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent
10 amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent, such as methanol or ethanol. Upon careful evaporation of the solvent, the desired solid salt is readily obtained. The desired acid salt can also be precipitated from a solution of the free base in an organic solvent by adding to the solution an appropriate mineral or organic acid.

15 Those compounds of formula 1 that are acidic in nature are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline-earth metal salts and particularly, the sodium and potassium salts. These salts are all prepared by conventional techniques. The chemical bases which are used as reagents to prepare the pharmaceutically acceptable base salts of this invention are those which
20 form non-toxic base salts with the acidic compounds of formula 1. Such non-toxic base salts include those derived from such pharmacologically acceptable cations as sodium, potassium calcium and magnesium, etc. These salts can easily be prepared by treating the corresponding acidic compounds with an aqueous solution containing the desired pharmacologically acceptable cations, and then evaporating the resulting solution to dryness, preferably under reduced
25 pressure. Alternatively, they may also be prepared by mixing lower alkanolic solutions of the acidic compounds and the desired alkali metal alkoxide together, and then evaporating the resulting solution to dryness in the same manner as before. In either case, stoichiometric quantities of reagents are preferably employed in order to ensure completeness of reaction and maximum yields of the desired final product. Since a single compound of the present invention
30 may include more than one acidic or basic moieties, the compounds of the present invention may include mono, di or tri-salts in a single compound.

The compounds of the present invention are potent inhibitors of the FAK protein tyrosine kinases, and thus are all adapted to therapeutic use as antiproliferative agents (e.g., anticancer), antitumor (e.g., effective against solid tumors), antiangiogenesis (e.g., stop or prevent
35 proliferation of blood vessels) in mammals, particularly in humans. In particular, the compounds of the present invention are useful in the prevention and treatment of a variety of human hyperproliferative disorders such as malignant and benign tumors of the liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, pancreatic, lung, vulval, thyroid, hepatic carcinomas, sarcomas, glioblastomas, head and neck, and other hyperplastic conditions such as
40 benign hyperplasia of the skin (e.g., psoriasis) and benign hyperplasia of the prostate (e.g.,

- 5 BPH). It is, in addition, expected that a compound of the present invention may possess activity against a range of leukemias and lymphoid malignancies.

In one preferred embodiment of the present invention cancer is selected from lung cancer, bone cancer, pancreatic cancer, gastric, skin cancer, cancer of the head or neck, cutaneous or intraocular melanoma, uterine cancer, ovarian cancer, gynecological, rectal
10 cancer, cancer of the anal region, stomach cancer, colon cancer, breast cancer, uterine cancer, carcinoma of the fallopian tubes, carcinoma of the endometrium, carcinoma of the cervix, carcinoma of the vagina, carcinoma of the vulva, Hodgkin's Disease, cancer of the esophagus, cancer of the small intestine, cancer of the endocrine system, cancer of the thyroid gland, cancer of the parathyroid gland, cancer of the adrenal gland, sarcoma of soft tissue, cancer of the
15 urethra, cancer of the penis, squamous cell, prostate cancer, chronic or acute leukemia, lymphocytic lymphomas, cancer of the bladder, cancer of the kidney or ureter, renal cell carcinoma, carcinoma of the renal pelvis, neoplasms of the central nervous system (CNS), primary CNS lymphoma, spinal axis tumors, brain, pituitary adenoma, or a combination of one or more of the foregoing cancers.

20 In a more preferred embodiment cancer is selected a solid tumor, such as; but not limited to, breast, lung, colon, brain, prostate, stomach, pancreatic, ovarian, skin (melanoma), endocrine, uterine, testicular, and bladder.

The compounds of the present invention may also be useful in the treatment of additional disorders in which aberrant expression ligand/receptor interactions or activation or
25 signalling events related to various protein tyrosine kinases, are involved. Such disorders may include those of neuronal, glial, astrocytal, hypothalamic, and other glandular, macrophagal, epithelial, stromal, and blastocoelic nature in which aberrant function, expression, activation or signalling of the erbB tyrosine kinases are involved. In addition, the compounds of the present invention may have therapeutic utility in inflammatory, angiogenic and immunologic disorders
30 involving both identified and as yet unidentified tyrosine kinases that are inhibited by the compounds of the present invention.

The *in vitro* activity of the compounds of formula 1 may be determined by the following procedure. More particularly, the following assay provides a method to determine whether compounds of the formula 1 inhibit the tyrosine kinase activity of the catalytic construct

III. FAKcd Kinase ELISA

- 15 1. Coat 96-well Nunc MaxiSorp plates with poly-glu-tyr (pGT) at 10 ug/well: Prepare 10 ug/ml of pGT in PBS and aliquot 100 ul/well. Incubate the plates at 37°C overnight, aspirate the supernatant, wash the plates 3 times with Wash Buffer, and flick to dry before storing at 4°C.

2. Prepare compound stock solutions of 2.5 mM in 100% DMSO. The stocks are subsequently diluted to 60X of the final concentration in 100% DMSO, and diluted 1:5 in Kinase Phosphorylation Buffer.

- 20 3. Prepare a 75 uM working ATP solution in Kinase phosphorylation buffer. Add 80 ul to each well for a final ATP concentration of 50 uM.

4. Transfer 10 ul of the diluted compounds (0.5log serial dilutions) to each well of the pGT assay plate, running each compound in triplicates on the same plate.

- 25 5. Dilute on ice, FAKcd protein to 1:1000 in Kinase Phosphorylation Buffer. Dispense 30 ul per well.

6. Note: Linearity and the appropriate dilution must be pre-determined for each batch of protein. The enzyme concentration selected should be such that quantitation of the assay signal will be approximately 0.8-1.0 at OD450, and in the linear range of the reaction rate.

7. Prepare both a No ATP control (noise) and a No Compound Control (Signal):

9. (Signal) Control wells receive 10 ul of 1:5 diluted DMSO (minus Compound) in Kinase phosphorylation buffer, 80 ul of 75 uM ATP, and 30 ul of 1:1000 FAKcd enzyme.

- 35 10. Incubate reaction at room temperature for 15 minutes with gentle shaking on a plate shaker.

11. Terminate the reaction by aspirating off the reaction mixture and washing 3 times with wash buffer.

- 40 12. Dilute phospho-tyrosine HRP-conjugated (pY20HRP) antibody to 0.250ug/ml (1:1000 of Stock) in blocking buffer. Dispense 100 ul per well, and incubate with shaking for 30min. at R.T.

13. Aspirate the supernatant and wash the plate 3 times with wash buffer.

5 14. Add 100 ul per well of room temperature TMB solution to initiate color development. Color development is terminated after approximately 15-30 sec. by the addition of 100ul of 0.09M H2SO4 per well.

 15. The signal is quantitated by measurement of absorbance at 450nm on the BioRad microplate reader or a microplate reader capable of reading at OD450.

10 16. Inhibition of tyrosine kinase activity would result in a reduced absorbance signal. The signal is typically 0.8-1.0 OD units. The values are reported as IC_{50s}, uM concentration.

 FAK cell-based Protocol for selectivity of kinase-dependent phosphoFAKY397

Procedure

35 An inducible FAK cell-based assay in ELISA format for the screening of chemical matter to identify tyrosine kinase specific inhibitors was developed. The cell-based assay exploits the mechanism of the GeneSwitchTM system (InVitrogen) to exogenously control the expression and phosphorylation of FAK and the kinase-dependent autophosphorylation site at residue Y397.

 Inhibition of the kinase-dependent autophosphorylation at Y397 results in a reduced
40 absorbance signal at OD450. The signal is typically 0.9 to 1.5 OD450 units with the noise falling in the range of 0.08 to 0.1 OD450 units. The values are reported as IC_{50s}, uM concentration.

5 On day 1, grow A431•FAKwt in T175 flasks. On the day prior to running the FAK cell-
assay, seed A431•FAKwt cells in growth media on 96-well U-bottom plates. Allow cells to sit at
37oC, 5% CO2 for 6 to 8 hours prior to FAK induction. Prepare Mifepristone stock solution of 10
uM in 100 % Ethanol. The stock solution is subsequently diluted to 10 X of the final
concentration in Growth Media. Transfer 10 ul of this dilution (final concentration of 0.1 nM
10 Mifepristone) into each well. Allow cells to sit at 37oC, 5% CO2 overnight (12 to 16 hours). Also,
prepare control wells without Mifepristone induction of FAK expression and phosphorylation.

 On day 2, coat Goat Anti-Rabbit plate(s) with 3.5 ug/ml of phosphospecific FAKpY397
polyclonal antibody prepared in SuperBlock TBS buffer, and allow plate(s) to shake on a plate
shaker at room temperature for 2 hours. Optionally, control wells may be coated with 3.5 ug/ml of
15 control Capture antibody (Whole Rabbit IgG molecules) prepared in SuperBlock TBS. Wash off
excess FAKpY397 antibody 3 times using buffer. Block Anti-FAKpY397 coated plate(s) with 200
ul per well of 3%BSA/0.5%Tween Blocking buffer for 1 hour at room temperature on the plate
shaker. While the plate(s) are blocking, prepare compound stock solutions of 5 mM in 100 %
DMSO. The stock solutions are subsequently serially diluted to 100X of the final concentration in
20 100% DMSO. Make a 1:10 dilution using the 100X solution into growth media and transfer 10 ul
of the appropriate compound dilutions to each well containing either the FAK induced or
uninduced control A431 cells for 30 minutes at 37oC, 5% CO2. Prepare RIPA lysis buffer (50
mM Tris-HCl, pH7.4, 1% NP-40, 0.25% Na-deoxycholate, 150 mM NaCl, 1 mM EDTA, 1 mM
Na3VO4, 1 mM NaF, and one Complete™ EDTA-free protease inhibitor pellet per 50 ml
25 solution). At the end of 30 minutes compound treatment, wash off compound 3 times using
TBS-T wash buffer. Lyse cells with 100 ul/well of RIPA buffer.

 To the coated plate, remove blocking buffer and wash 3 times using TBS-T wash buffer.
Using a 96-well automated microdispenser, transfer 100 ul of whole cell-lysate (from step 6) to
the Goat Anti-Rabbit FAKpY397 coated plate(s) to capture phosphoFAKY397 proteins. Shake at
30 room temperature for 2 hours. Wash off unbound proteins 3 times using TBS-T wash buffer.
Prepare 0.5 ug/ml (1:2000 dilution) of UBI αFAK detection antibody in 3%BSA/0.5% Tween
blocking buffer. Dispense 100 ul of UBI αFAK solution per well and shake for 30 minutes at
room temperature. Wash off excess UBI αFAK antibody 3 times using TBS-T wash buffer.
Prepare 0.08 ug/ml (1:5000 dilution) of secondary Anti-Mouse Peroxidase (Anti-2MHRP)
35 conjugated antibody. Dispense 100 ul per well of the Anti-2MHRP solution and shake for 30
minutes at room temperature. Wash off excess Anti-2MHRP antibody 3 times using TBS-T
wash buffer. Add 100 ul per well of room temperature TMB substrate solution to allow for color
development. Terminate the TMB reaction with 100 ul per well of TMB stop solution (0.09M
H2SO4) and quantitate the signal by measurement of absorbance at 450 nm on the BioRad
40 microplate reader.

5 Additional FAK cell assays are hereby incorporated by reference from Pfizer Attorney Docket No. PC11699 entitled "INDUCIBLE FOCAL ADHESION KINASE CELL ASSAY".

Administration of the compounds of the present invention (hereinafter the "active compound(s)") can be effected by any method that enables delivery of the compounds to the site of action. These methods include oral routes, intraduodenal routes, parenteral injection
10 (including intravenous, subcutaneous, intramuscular, intravascular or infusion), topical, and rectal administration.

The amount of the active compound administered will be dependent on the subject being treated, the severity of the disorder or condition, the rate of administration, the disposition of the compound and the discretion of the prescribing physician. However, an effective dosage
15 is in the range of about 0.001 to about 100 mg per kg body weight per day, preferably about 1 to about 35 mg/kg/day, in single or divided doses. For a 70 kg human, this would amount to about 0.05 to about 7 g/day, preferably about 0.2 to about 2.5 g/day. In some instances, dosage levels below the lower limit of the aforesaid range may be more than adequate, while in other cases still larger doses may be employed without causing any harmful side effect, provided that such larger
20 doses are first divided into several small doses for administration throughout the day.

The active compound may be applied as a sole therapy or may involve one or more other anti-tumour substances, for example those selected from, for example, mitotic inhibitors, for example vinblastine; alkylating agents, for example cis-platin, carboplatin and cyclophosphamide; anti-metabolites, for example 5-fluorouracil, cytosine arabinoside and
25 hydroxyurea, or, for example, one of the preferred anti-metabolites disclosed in European Patent Application No. 239362 such as N-(5-[N-(3,4-dihydro-2-methyl-4-oxoquinazolin-6-ylmethyl)-N-methylamino]-2-thenoyl)-L-glutamic acid; growth factor inhibitors; cell cycle inhibitors; intercalating antibiotics, for example adriamycin and bleomycin; enzymes, for example interferon; and anti-hormones, for example anti-estrogens such as Nolvadex™ (tamoxifen) or, for example
30 anti-androgens such as Casodex™ (4'-cyano-3-(4-fluorophenylsulphonyl)-2-hydroxy-2-methyl-3'-(trifluoromethyl)propionanilide). Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate dosing of the individual components of the treatment.

The pharmaceutical composition may, for example, be in a form suitable for oral administration as a tablet, capsule, pill, powder, sustained release formulations, solution,
35 suspension, for parenteral injection as a sterile solution, suspension or emulsion, for topical administration as an ointment or cream or for rectal administration as a suppository. The pharmaceutical composition may be in unit dosage forms suitable for single administration of precise dosages. The pharmaceutical composition will include a conventional pharmaceutical carrier or excipient and a compound according to the invention as an active ingredient. In
40 addition, it may include other medicinal or pharmaceutical agents, carriers, adjuvants, etc.

5 Exemplary parenteral administration forms include solutions or suspensions of active compounds in sterile aqueous solutions, for example, aqueous propylene glycol or dextrose solutions. Such dosage forms can be suitably buffered, if desired.

Suitable pharmaceutical carriers include inert diluents or fillers, water and various organic solvents. The pharmaceutical compositions may, if desired, contain additional
10 ingredients such as flavorings, binders, excipients and the like. Thus for oral administration, tablets containing various excipients, such as citric acid may be employed together with various disintegrants such as starch, alginic acid and certain complex silicates and with binding agents such as sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often useful for tableting purposes. Solid
15 compositions of a similar type may also be employed in soft and hard filled gelatin capsules. Preferred materials, therefor, include lactose or milk sugar and high molecular weight polyethylene glycols. When aqueous suspensions or elixirs are desired for oral administration the active compound therein may be combined with various sweetening or flavoring agents, coloring matters or dyes and, if desired, emulsifying agents or suspending agents, together with
20 diluents such as water, ethanol, propylene glycol, glycerin, or combinations thereof.

Methods of preparing various pharmaceutical compositions with a specific amount of active compound are known, or will be apparent, to those skilled in this art. For examples, see Remington's Pharmaceutical Sciences, Mack Publishing Company, Easter, Pa., 15th Edition (1975).

25 The examples and preparations provided below further illustrate and exemplify the compounds of the present invention and methods of preparing such compounds. It is to be understood that the scope of the present invention is not limited in any way by the scope of the following examples and preparations. In the following examples molecules with a single chiral center, unless otherwise noted, exist as a racemic mixture. Those molecules with two or
30 more chiral centers, unless otherwise noted, exist as a racemic mixture of diastereomers. Single enantiomers/diastereomers may be obtained by methods known to those skilled in the art.

- 30 To 600 mL of HPLC-grade methanol was added 60.0 g (1.11 mol) sodium methoxide portion-wise. The resulting white slurry was allowed to stir for ten minutes before adding 30.0 g (185 mmol) 5-nitroindole. This allowed to stir for an additional ten minutes before adding

5 92.2 g (463 mmol) 4-Oxo-piperidine-1-carboxylic acid tert-butyl ester. After waiting ten minutes, the reaction temperature was ramped to 85° C which was maintained for thirty-two hours. The black reaction solution was cooled to 0° C and 250 mL distilled water was added drop-wise under nitrogen via an equalizing pressure addition funnel.
